What Role and Responsibilities did you have during the Game Project?

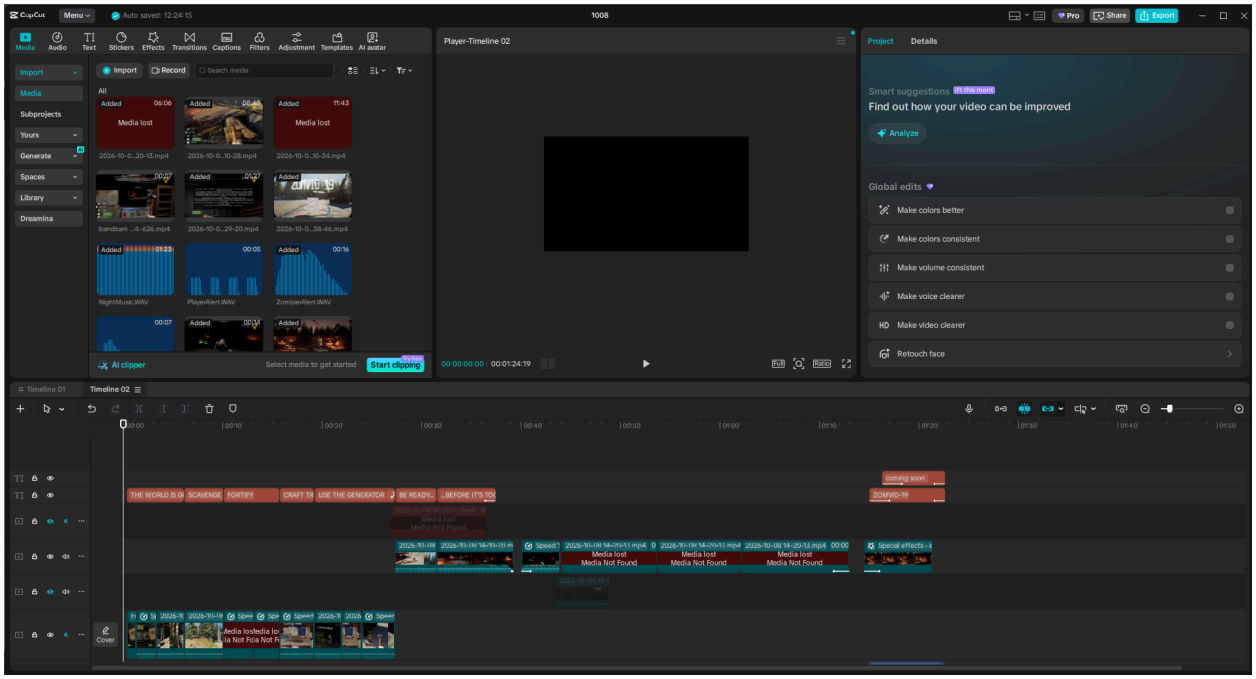

I was the product owner (since the prototype was my idea), team leader, producer and main game designer.

- **As product owner, I was in charge of making the Miro board, the Unreal Engine project, and github repository. Once we had the project ready for them to start working, I switched to gathering all the necessary assets for the rest of the team to build upon: weapons, zombies, environmental and other models, sound effects, music, ambience, VFX. I worked together with our artist to maintain visual cohesion in art style for said assets. Then, I was assisted by the producers to keep me in line with the concept, reminded me the deadline, and gave me feedback on both production as well as the game in general. And lastly, I created the the presentation and trailer for our game.**

- **As game designer, I tried making a GDD as soon as possible to guide the team member to work on the required features, improvements and fixes to the original prototype. I was in charge of adding the previously listed items to the corresponding features: new models, sfx, vfx, and more, impacting many blueprints and systems. I created several new blueprints such as: the barrels to create illumination, loot spawner and loot manager. I did bug fixing,**

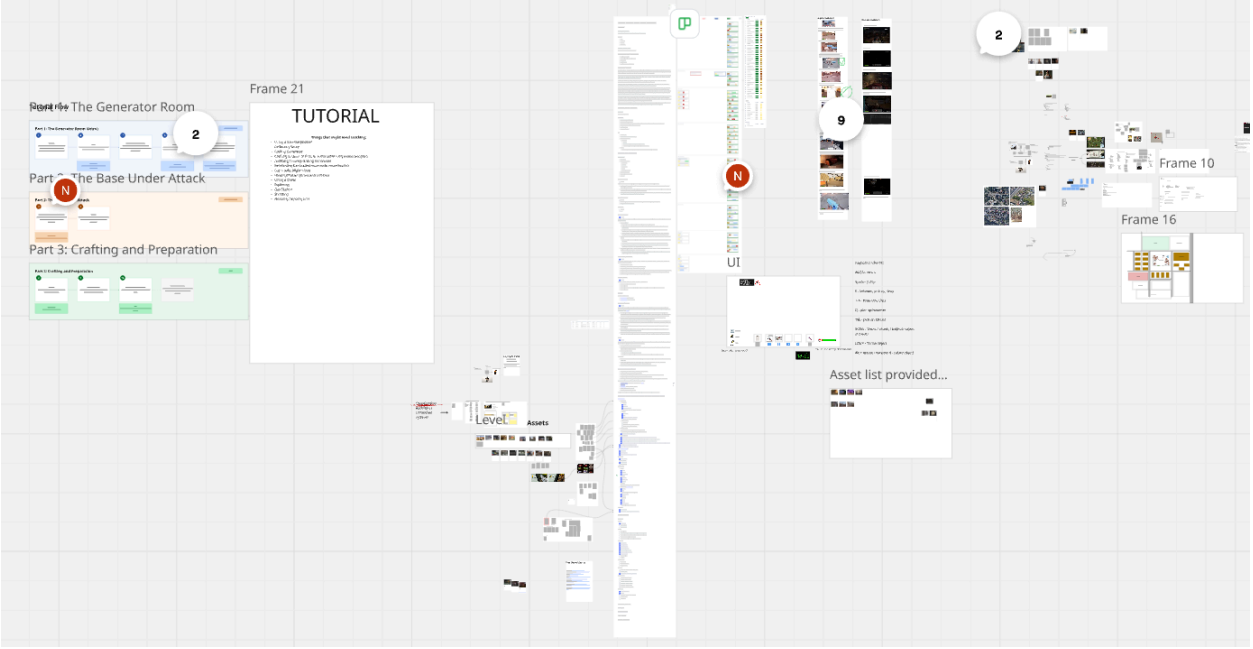

improvements and balacing on several, if not most, of the blueprints made by me or other members to alling with my vision. I did some sound editing and 3d modelling. Used the tutorial tools (created by the programmer) to make the current tutorial. I was in charge of making the different builds.

- **As for the management and production, I created the structure (explained in detail in the next question) and I was responsible to use it to creating, assigning and keeping track of members tasks and the general progress of the game.**

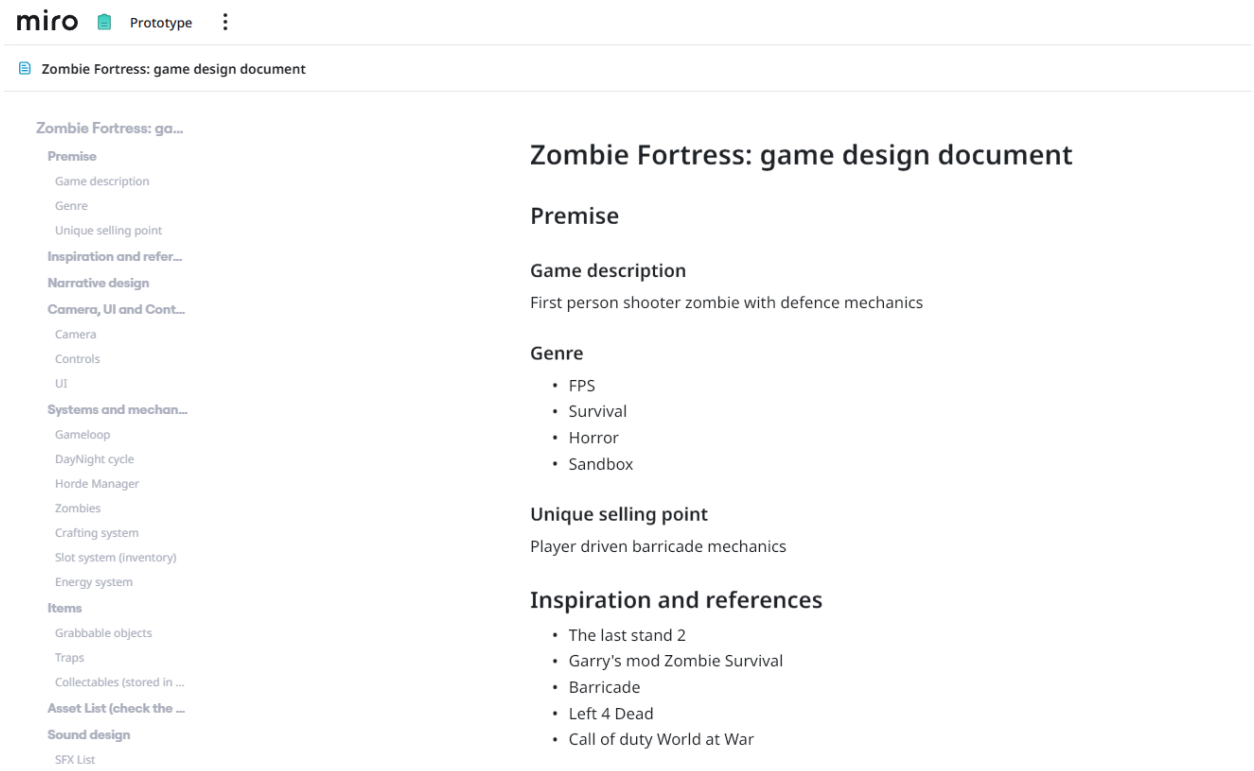

<u>How did your team set up and work with project management?</u>

<u>What tools and processes was used?</u>

I created a Miro board where all the member could join and contribute by adding ideas, explaining concepts, develop them futher or even propose new ones:
https://miro.com/app/board/uXjVHvWENxQ=/?share_link_id=246443047222

Then I created a document inside the same board to work as a GDD listing the current features, explaning new ones and improving the old systems, as well as listing assets to be added.

Finally, I added a kanban board to be used to track each task per member and development phase (alpha, beta, gold).
